

“OBSERVING CHILDREN IN DANGER AND CHILD PROTECTION : advantages and limitations of different mechanisms”, Paris, France, 20/03/2015

“Observing children in danger in Greece and in the Balkans”

George Nikolaidis(*)

Psychiatrist, MD, MA, MSc, PhD

Center for the Study and Prevention of Child Abuse and Neglect,
Department of Mental Health. Institute of Child Health

(*) but also many-many good colleagues from Dep. of MHSW in ICH and other collaborating organizations

An overview of the issue at stake: building the evidence base for effective child protection policies

Milestones of development for CAN research and interventions

- Initially Medical-centered model
- In turn, influenced by Women's and Human Rights' Movements, research often dominated by victimological studies
- Sometimes over-charged with values, beliefs, ideologies or even preoccupation of pioneers
- Gradually fine-grained through understanding of relative autonomy of scientific evidence and rightful human rights' agenda
- During the last couple of decades entering the **evidence-based practice** paradigm
- Augmented by the necessary **practice-based evidence**

Empirical diversities or paradigm instability?

QUESTIONS	YES	NO
Is theory of the "circle of violence" true concerning both sexual & physical CAN?	Knopp (1984), Hilton & Mezey (1996)	Murphy & Smith (1994), Widom & Ames (1994), Glasser et al. (2001)
Is voluntary sexual activity of adolescents related with latent psychological and social implications of CAN?	Kendall-Tackett et al. (1993), Ondersma et al. (1999), Dallam et al. (1999)	Rind & Tromovitch (1997), Coxell et al. (1999), Rind et al. (2001)
Is internet pedophilia related with actualized sexual CAN?	Hanson & Bussiere (1998), Proulx et al. (2000)	Loussier et al. (2001), Frei et al. (2005)
Are there any specific neuro-biological or neuro-imaging signs of CAN?	Hulme (2004), Kendall-Tackett (2005)	Kaufman & Charney (1999), Glaser (2000), Teicher et al. (2006)
Is preventive therapy for asymptomatic victims of CAN effective?	Jones & Ramchandani (1999), Trowell et al. (2002)	Tebutt et al. (1997), Stevenson (1999)
Is there a genetic determinant in CAN?	Caspi et al (2002, 2003), Foley et al. (2004), Kim-Cohen et al. (2006)	Huizinga et al. (2005), Haberstick et al. (2005)
Is pregnancy in adolescence related to increased CAN rates?	Moore et al. (1997), Olausson et al. (2001)	Kirby (1999), Hillis et al. (2004)
Can false CAN memories rise out of therapy?	Yapko (1994), Loftus & Pickrell (1995), Loftus (1997), Pope (1998)	Berliner & McDougall (1997), Pezdek & Roe (1997), Poter & Marxen (1998)
Can victimological, clinical research findings be projected to populations?	Black & DeBlasie (1993), McMillen et al. (1995), Rodriguez et al. (1996), Holms & Slap (1998), Najman et al. (2005)	Beichtman et al. (1991, 1992), Jenkins (1998), Rind & Tromovitch (2007)

CAN Data Collection: modalities and their usefulness

- **Mapping:** representing as much accurately as possible the extent and features of the characteristic under investigation, viz. CAN
- **Monitoring:** Ongoing recording and supervision of development and trends of the given characteristic (CAN) both aggregative and on an individual basis
- **Surveillance:** Permanent mechanisms for detection of hazardous trends on the overall development of the given characteristic (CAN) or on a particular instantiation of it (e.g. on a certain individual or group of individuals) – usually accompanied by mechanisms of early intervention to prevent increase of risk

WHO & ISPCAN, (2006):
***"Preventing child
maltreatment: a guide to
taking action and generating
evidence"***

**Towards evidence-based
research methodologies
on CAN globally**

Recommended research tools
appropriate for international
comparisons:

- ICAST (-CH, -CW/I, -P, -R)
- ACE (Adverse Childhood Experiences)
- CTS (Parent–Child Conflict Tactic Scale)
- LVS (Lifetime Victimization Screening)

CAN Data Collection: public health approach to child maltreatment

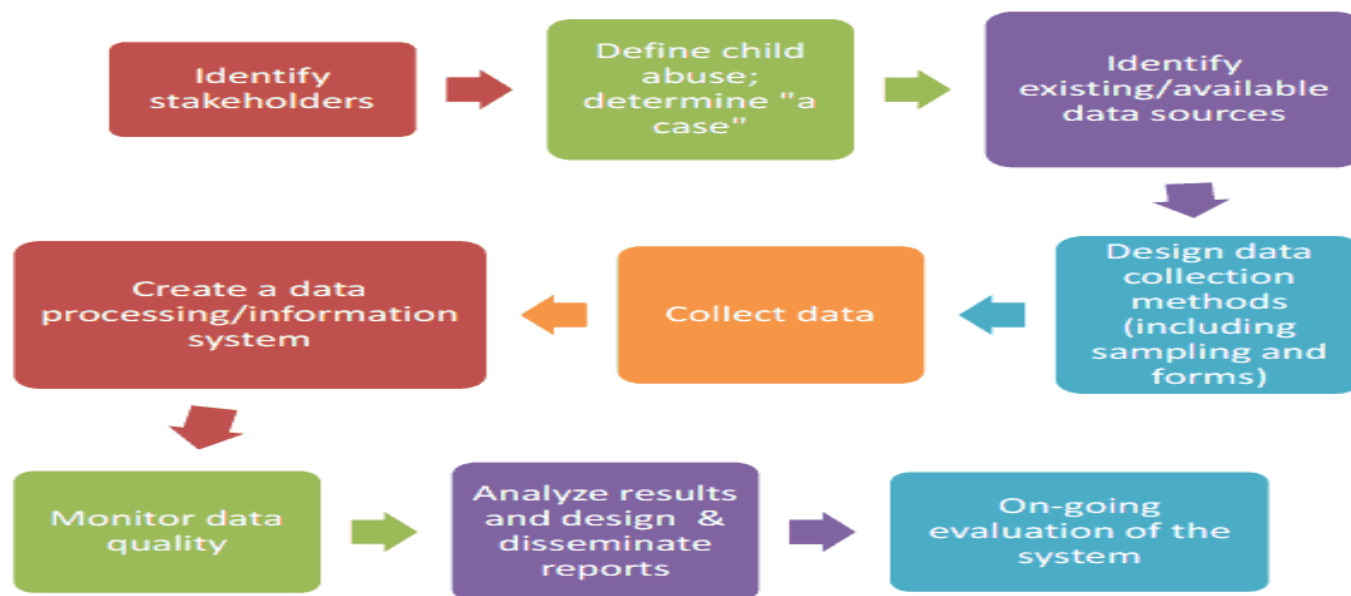

- A multi-sectoral approach:

- 4 steps:

1. surveillance to define the magnitude of the problem
2. analysis to highlight the risk factors and risk groups
3. evaluative research to identify effective interventions
4. implementation of what works at a broader level

(WHO 2007, Preventing child maltreatment in Europe, Violence and Injury Prevention Programme, WHO Regional Office for Europe)

Steps in designing and building a child maltreatment data collection and surveillance system

Adapted from Holder, Peden & Krug et al. (2001).

CHILDONEUROPE, (2009): "Guidelines on Data Collection and Monitoring Systems on Child Abuse"

- **Specification among others of Guidelines for: Administrative CAN-related Data Collection**

Table 2. Examples of Central Registries for the Reporting of CAN cases

Europe	Flanders (Belgium), France, Ireland, Spain, Portugal, Slovakia, Bosnia& Herzegovina, Croatia, Romania, Italy, FYROM (only sexual abuse)
USA (states) 2	Alabama, Alaska, Arizona, Arkansas, California, Connecticut, Delaware, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana, Iowa, Louisiana, Maryland, Massachusetts, Michigan, Mississippi, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Wyoming
Canada (states) 5	✓ (e.g. Manitoba, Nova Scotia, Ontario, Alberta)
Australia (states)	Northern Territory, Western Australia, Tasmania

An overview of CAN Surveillance Systems: Child abuse & neglect systematic record keeping

An overview of CAN Surveillance Systems:

Type of information most commonly included in department records and central registries

Table 3. Type of data most commonly collected

Categories	Variables										Category	Variables
	Name	Date of birth/age	Contact Info	Vulnerability factors	Protective or resilience factors	Culture	School info	Relation to child	Health history (mental problems, substance use, domestic violence)		Abuse/Neglect	Type of abuse
Child-Victim	✓	✓	✓	✓	✓	✓	✓					Duration and Multiplicity
Offender	✓	✓						✓	✓			Indicators
Parents/ caregivers	✓	✓	✓				✓		✓			Consequences
Roommate(s)	✓	✓						✓				Disclosure, claims of the child
Reporter	✓		✓					✓				History of abuse
												Name and date of birth/age of other children-possible victims

CAN data reported in the Balkans: the BECAN project

Project's Identity

- **Contract Number:** HEALTH-F2-2009-223478
- **Type of Project:** Collaborative
 - Call: FP7-HEALTH-2007-B

- **Co-funding:**
 - Research Directorate General EC
 - 9 Balkan Participating Organizations
- **Duration:** 40 months
 - October 2009 - March 2013
- **Participating countries**
 - Albania
 - Bosnia & Herzegovina
 - Bulgaria
 - Croatia
 - Former Yugoslav Republic of Macedonia
 - Greece
 - Romania
 - Serbia
 - Turkey

BECAN project's main outcomes

- **Quantitative, empirical documentation of the high rates of children's violence exposure**
- **Innovative documentation of high rates of girls' exposure to physical violence and boys' exposure to sexual violence**
- **Quantitative mapping of authoritative agencies' sensitivity in receiving CAN reports per country**

SERBIA	5,59	7,06	-1,19	-1,05	-1,86	-2,57	-2,16	-2,31	11,18	9,38	1,20	0,91
TURKEY	0,61	0,47	-4,46	-4,84	N/A*				10,87	10,95	1,46	1,94

1. **PR. = Prevalence:** percentage of children reporting having experienced at least 1 behavior of the scale during their entire life time (either in the past year or before)

2. **INC. = Incidence:** percentage of children reporting having experienced at least 1 behavior of the scale [independently of the frequency score declared under "During the past year (previous 12 months)"]

* the sexual violence scale was not included in the ICAST-CH questionnaire

Overall conclusions

- Almost half of the children reported at least one experience of exposure to physical violence during the year prior to research in all participating countries, while almost two out of three report such a history during their childhood. Rates of exposure to psychological violence appear even higher, reaching in many of the participating countries almost two thirds of responding children for incidence and even three quarters on some occasions for prevalence. Such an image can be better understood when combined with sex distribution figures: pace standard conceptualization and prior research reports that physical violence predominantly concerns boys; this particular research advocates for a more equated distribution pattern with male to female ratios being almost equivalent to one and in some cases females' report exceeding male ones.
- Increased rates of self-reported exposure to sexual violence of children were found as well, even more alarmingly regarding contact sexual violence. In that type there was also an almost equation of boys : girls ratio with small predominance of boys in younger ages and reverse trend in adolescent children while rates in urban areas exceed ones in rural ones in younger children while the ratio is reversed in adolescent children implying the possibility of two potential patterns of children's exposure to sexual violence: one in smaller children and one in adolescents (the later more resembling features of adult sexual violence). In any case, a good portion of self-reported sexual victimization seems to occur between 13 and 16 years of age of children victims.
- Finally, subjective feelings of neglect are clearly reported more by female children. Moreover, further analysis showed that these feelings, especially in girls, increase in percentages as moving to higher school grade groups, namely as moving towards adulthood. This finding was also more or less consistent for most of the participating countries.

Kick-off meeting of Balkan Epidemiological study on Child Abuse and Neglect

December 3rd, 2009

Press Release

Subject: Kick-off meeting of Balkan Epidemiological study on Child Abuse and Neglect (BE CAN)

Source: Institute of Child Health, Department of Mental Health and Social Welfare – Centre for the Study and prevention of Child Abuse and Neglect (Head G. Nikolaidis.)

The **largest epidemiological study on Child Abuse and Neglect (CAN)** ever conducted in the Balkan region in terms of sample, exceeding 30.000 children and parents, begins with the **Kick-off Meeting** of Research Centers and Organizations' representatives that participate in the European Project titled **BE CAN**, taking place in Athens, on Monday 7/12/2009.

This ambitious project is one of the largest studies in sample size globally. The importance of its anticipated results as well as its innovative character is in virtue of the fact that, until now, there are no data available on the general population prevalence of CAN not only for the totality of the Balkans, but also at national level of individual countries. **Coordinator** of the project is the **Department of Mental Health and Social Welfare – Centre for the Study and prevention of Child Abuse and Neglect of Institute of Child Health in Greece.**

Council of Europe's Lanzarote Committee's current monitoring round on CAN data collection mechanisms in CoE's member states (2014-2015)

COUNCIL OF EUROPE

CONSEIL DE L'EUROPE

Institute of Child Health
Department of Mental Health and Social Welfare
Centre for the Study and Prevention of Child Abuse and Neglect

With financial support from
the EU DAPHNE Programme

**"OBSERVING CHILDREN IN DANGER
AND CHILD PROTECTION",
Paris, France, 20/03/2015**

Overall characteristics -1

- Incommensurability of countries' existing mechanisms
- Situation varies especially by:
 - Sector involved (welfare, health, justice, law enforcement)
 - Registering unit (child, incident, offence, offender, family)
 - Aggregative or case based data resources
- Respectful variation in respect to registering data for victims, offenders or both and/or offences
- Respectful variation of variables registered

Predominant and secondary resources of data collection

Sector	Predominant	Supplementary
Social Welfare	Belgium, Bosnia, Bulgaria, France, Iceland, Italy, Lithuania, Malta, Moldova, Romania, Serbia, Spain, F.Y.R. of Macedonia	Austria, Croatia, Denmark, Montenegro, San Marino
Justice	Austria, Croatia, Finland, San Marino, Turkey, Ukraine	Belgium, Bosnia, France, Iceland, Italy, Lithuania, Malta, Montenegro, Portugal
Law Enforcement	Albania, Portugal	Austria, Belgium, Iceland, Finland, Spain
Health	Greece, Montenegro	Iceland, Portugal, San Marino, Serbia, Spain

Type of data collection

Case based data for the victim	Some short of data for the victim	Case based data for the offence	Case based data for offenders	Some short of data for the offenders
France, Iceland, San Marino, Serbia and partially Belgium	Austria, Belgium, Bosnia, Bulgaria, Croatia, Denmark, F.Y.R. of Macedonia, Iceland, Italy, Lithuania, Malta, Romania, Serbia, Spain and maybe some more	Albania, Austria, Croatia, France, Lithuania, Moldova, Portugal, Spain, Ukraine and possibly also Iceland, Finland and other countries	Austria, Croatia, Lithuania, Malta, Netherlands and Serbia	Austria, Belgium, Bulgaria, Croatia, Malta and Serbia and some more

Case based vs. Aggregative data

Case based data

Austria, partially Belgium, Bulgaria, France, Iceland, Lithuania, Malta, Montenegro, Portugal, Romania, San Marino, Serbia and Spain

Aggregative data

Albania, Austria, Belgium, Bosnia, Bulgaria, Denmark, France, Iceland, Lithuania, Malta, Portugal, Romania, San Marino, and Spain but also probably in some others reporting keeping records of case based data (which can be easily aggregated)

Overall characteristics - 2

- In general, not specific mechanisms but:
 - either general CAN/CP data collection systems or
 - general administrative data registering practices (i.e. juridical cases/hospital records)
- Lack of linkage between data collected by different sectors (in most of cases)
- General lack of appointment of focal points or mandated agency to collect data (apart from National Strategic Plans etc)
- Lack of consideration regarding quality of data collection, adequacy of existing mechanism, coverage of data collection, ongoing improvements etc

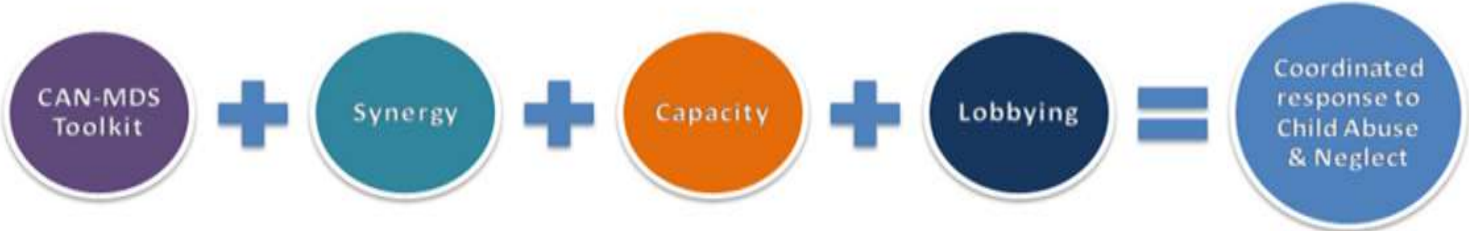

Other remarks

- Some countries are currently developing data collection mechanisms (Greece, Italy, Portugal, Spain and Turkey)
- Some parties have other existing registering resources on children victims of trafficking (Bosnia, Italy, Moldavia, Romania, Serbia), victims of child pornography (Italy), one-off research mapping initiatives (Greece, Italy) or other such registries
- Some form of registering the relationship between the victim and the offender exists in countries such as Austria, part of Belgium, Croatia, Portugal and San Marino
- Countries that have some mandated service for assessment of CSA allegations (Child Advocacy Centers, Child Protection Centers etc) seem to enriched have case based and aggregative information registered

Response: EU/DAPHNE-funded project CAN-MDS

“Coordinated Response to Child Abuse and Neglect (CAN) via Minimum Data Set (MDS)”

<http://www.can-via-mds.eu/>

HOME ABOUT THE PROJECT OTHER ASPECTS OF THE PROJECT USEFUL LINKS FORUM CONTACT US DISCLAIMER SITEMAP

WELCOME

Child abuse and neglect (CAN) case-based data across the EU are derived from a variety of intersectoral sources and follow up of victims at local & national level is not sufficiently coordinated among the involved services. The main barriers for effective CAN monitoring are the lack of common operational definitions, registering practices and the use of a variety of methods & tools for data collection & sharing among stakeholders. At international level, given that existing surveillance mechanisms vary considerably in coverage and completeness, comparisons are not feasible. The Project “Coordinated Response to Child Abuse and Neglect via Minimum Data Set” [JUST/2012/DAP/AG/3250] co-founded under Daphne III Programme aims at creating the scientific basis, tools & synergies for establishing national CAN monitoring systems using a minimum data set (MDS). Such systems would provide comprehensive, reliable and comparable case-based information at national level for children who have used protection services (social, health, educational, etc. depending on countries' specifics) also facilitating CAN monitoring at EU

Child maltreatment as an "Iceberg" (CHILDONEUROPE, 2009)

However, if someone compares what is found by children's reports and recorded cases, figures – however inaccurate – speak for themselves...

Incidence Rates	Type of exposure to violence				
	Psychological	Physical	Sexual	Contact Sexual	Neglect
Self-reported Survey	70,02	47,38	9,54	4,45	26,41
Reported Cases Study	0,53	0,18		0,07	0,46
Ratio	0,76	0,38	0,73	1,57	1,74

- Results presented are concerning prefectures of Attica and Crete referring to calendar year 2010 (field survey vs. case-based surveillance study's results). Extrapolation was calculated for CBSS's results based on national statistics on children's population and the ration of participation of agencies to the study in respect to the totality of agencies dealing with CAN cases.
- Even if one doubles first row's figures (in virtue of non-collaborating agencies), even if one divides by 10 second row's figures (for counting only more severe cases of children's adverse experiences), conclusion still remains the same in terms of social policy deficits:
 - **In Greece some professional assistance is provided to less than 1 in 10 children experiencing some short of violence, victimization or in any case adverse experience**
 - **It is the first time that the "iceberg" phenomenon on CAN cases was quantitatively documented**

Response: Building a comprehensive and inter-sectoral national registry for CAN cases in Greece

Institute of Child Health
Department of Mental Health and Social Welfare
Centre for the Study and Prevention of Child Abuse and Neglect

With financial support from
the EU DAPHNE Programme

Observatoire National
de l'Enfance en Danger

**"OBSERVING CHILDREN IN DANGER
AND CHILD PROTECTION",
Paris, France, 20/03/2015**

Steps in designing and implementing a CAN surveillance system in Greece

1. Conducting an extended literature review on procedures and variables of other countries' CAN registering or surveillance systems
2. Conducting a similar review on available data by national research (one-off) resources
3. Drafting accordingly a first set of potential variables to be included in the Hellenic system
4. Conducting a first round of consultation with 5 top experts (consensus panel) of various sectors and professional background and consequently concluding to a smaller variables' list
5. Conducting a second round of public consultation with 50 experts by various sectors and professions involved as well as leading national scientific associations and consequently concluding to the list of variables for the pilot phase
6. Developing software application for implementation of the registering system
7. Piloting the registry with 5 major volunteering organization by governmental and NGO sectors and consequent readjustment based on that experience
8. Continuing recruitment of organizations and agencies for adopting the usage of the registry (bottom-up process)
9. Concluding final variables and procedures' set and begin normal operational mode
10. Ongoing regular re-assessment of the registry's main features

Final Outcome: the system in short

- An electronic database in which professionals will register all reported cases of child abuse and neglect.
- Data from various sources (social services, healthcare settings, law enforcement, justice).
- Variables regarding the victim, the incident of maltreatment, the alleged perpetrator, the investigation status and possible risk factors.

Variables (1)

a. User

1. Username
2. Password
3. Region
4. Regional Unit
5. Municipality
6. Name of the agency/service
7. Access date

b. Child

1. ID number of the child
2. Gender
3. Age
4. Citizenship
5. Availability of address
6. Residence
7. Working status
9. Permanent residence
10. School attendance
11. Social Insurance
12. Biological parents
13. Roommates ID
14. Report of CAN regarding another child

Variables (2)

c. Maltreatment

- 15. Type
- 16. Referral source
- 16. Date of the 1st referral
- 17. Name of the agency/service that received the 1st report
- 18. Date of the first report
- 19. Duration or multiplicity of the abuse
- 20. Date of the 1st incident of abuse

d. Case Investigation

- 21. Investigation result
- 22. Police involvement
- 23. Justice involvement
- 24. Agencies/services involved

Variables (3)

e. Alleged perpetrator

- 25. Relationship to the child
- 26. Gender
- 27. Age group
- 28. Confirmation of the perpetrator
- 29. Referral to the court
- 30. Jurisdiction

f. Clinical intervention

- 31. Therapeutic intervention on the child
- 32. Therapeutic intervention on the family
- 33. Therapeutic intervention on the perpetrator

g. Risk factors

- 34. Of the child
- 35. Of the family
- 36. Of the alleged perpetrator

Greece's National CAN registry's comprehensive goals and objectives

- ❑ Register all reported cases of child maltreatment
- ❑ Measure the scope and magnitude of child maltreatment
- ❑ Develop a network for the effective collaboration and coordination of all professionals involved in child abuse and neglect cases
- ❑ Inform and guide professional practice
- ❑ Unifying criteria for detecting and classifying child abuse cases
- ❑ Inform and guide policy makers of possible risks and trends affecting health and safety
- ❑ Prevent multiple victimization
- ❑ Set priorities for prevention and intervention

At the top, there is a navigation bar with a logo of a hand and the text "Πρωτόκολλο Διερεύνησης, Διάγνωσης, Διαχείρισης ΚΑΠα-Π & Εθνικό Σύστημα Αναφοράς ΚΑΠα-Π" on the left, and a menu with "ΑΡΧΙΚΗ", "ΤΟ ΠΡΟΓΡΑΜΜΑ", "ΠΡΩΤΟΚΟΛΛΟ ΕΣΑ ΚΑΠΑ-Π", "FORUM", and "ΕΠΙΚΟΙΝΩΝΙΑ" on the right. The main content area has a dark red background with the text "Ακολουθήστε το Πρωτόκολλο Χρησιμοποίησε το ΕΣΑ" in white. Below this, there is a black section with the text "ΟΛΟΚΛΗΡΩΜΕΝΗ ΠΡΟΣΕΓΓΙΣΗ..." and a subtext "... για τη Διερεύνηση, Διάγνωση και Διαχείριση Περιστατικών Κακοποίησης & Παραμέλησης Παιδιών". To the right of this text is a button that says "ΔΙΑΒΑΣΤΕ ΠΕΡΙΣΣΟΤΕΡΑ" with a right arrow icon. At the bottom of the main content area, there are four logos: a hand in a circle, the IYPI logo, a logo with four hands, and a logo with a stylized figure.
